Statistics: Mean 30.954; Variance 153.640; scale 0.202

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Stimulating prodn. of variable region gene family restricted antibodies - through B-cell super-antigen vaccination Disclosure; Fage 78; 130pp; English.

A B-cell superantigen (849) is a fragment of SpA D domain that specifically binds the Fab portion of variable region restricted antibodies. The SAG is used to enhance production of VH; especially antibodies. Thuring attempts to identify sAGs, as sequences (R54784-801) of H chains from Ig reactive with mod SpA, and as and DAS sequences (R4801).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 vhlv-qsgaevkkpgssvkvsckasggtfssyaiswvrqapggglewmggiipifg--g- 56

additional N-linked qlycosylation sites are introduced at locations which impair complement fixing and Fc receptor binding ability. They are preferably located in the CH2 region of the Iq molecule. Antibodies bearing multiple slalyl-Lex determinants are useful for disrupting undesirable interactions between cells or proteins. Disrupting this interaction has therapeutic applications, for example, in minimising inflammation following tissue injury.
                                                                                                                                                                                                                                                                                                       1 EVOLLEQSGAEVRRPGSSVKVSCKASGGTFSGHVITWVRQAPGQGLEWMGESIPIFGSAN 60

The sequences given in Kil023-24 represent the heavy and light, chaims of Antibody D is a monoclonal antibody which of Antibody D is a monoclonal antibody Which was derived from peripheral blood 'imphocytes from a hepatitis A virus (RAV) sero positive patient. Antibody D is closely related in nature to murine antibody BSB3. Total RNA was isolated from antibody D expressing cells and polyademylated RNA was extracted. These polyA RNA's were used to prepare a cDNA library which was screened for human kappa light (L) chains and two positive clones were detected. Sequence 476 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This polypeptide sequence comprises the heavy chain variable region (VH), HBBIL, obtained by mutagenesis of the VH CDFT of human carcinombryonic antigen (hCBA) -specific antibody CEAG (see W19881). A Claimed specific binding member (A) comprises an hCEA specific antibody antigen binding member (A) comprises an hCEA specific antibody antigen binding domain that has a dissociation constant for hCEA of less than 1 x 10 - 8 W, is non-cross-reactive with human liver cells, and preferentially binds to the A3-B3 extracellular domain of hCEA and/or to cell-associated hCEA over the hCEA over soluble hCEA. Preferred (A) include pairings of VH and CV L sequences from CEA1-7 (see W19876-85), or their CDR sequences, as well as CEA6 VH and VL variants (see W19886-95) obtained by mutagenesis or chain shuffling. An example of a claimed pairing is HBBIL VH with CEA6 VL. (A) is used to detect cells expressing hCEA, in vivo or in vitto, especially tumour cells for diagnosing cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 YAQNYAQKFPDRVSITADESTSTSFIELSNLPSDDTAVYYCAPRPPPRYCSAGPCYPGFFQ 120

                                                                                                                                                                                                                                                                                                                                                                       Graves' cphthalmopathy-associated monoclonal antibody - produced by molecular cloning of immunoglobulin genes by PCR by molecular cloning of immunoglobulin genes by PCR becourer, Page 68: 94pp; English.

L- and H-chain DNA was amplified by PCR from Graves' orbital tissue and clones encoding autoimmune-associated immunoglobulin fragments were obtained. 13/15 clones of H chain (1961) genes showed homology to the closest germline genes, DF12 (2022) and PH1253 (202320). The DNA (2009322) and corresp. amino acid OF7H1.2, are provided.

Sequences of the VH region of a representative clone, Sequence 98 AA:

                                                                                                                                                       This polypeptide sequence comprises the heavy chain variable region (VH) of human carcinoembryonic antigen (hCEA)-specific antibody CEA. VH (T72126-32) and VL (T7213-35) gene sequences were obtained for anti-hCEA antibodies CEA1-CEA7 (see W19876-85). A claimed specific binding member (A) comprises an hCEA specific antibody antigen binding domain that has a dissociation constant for hCEA of less than 1 x 10 -8 M, is non-cross-reactive with human liver cells, and preferentially binds to the A3-B3 extracellular soluble hCEA. Preferred (A) include pairings of VH and VL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 gvqlv-gsgaevkkpgssvkvsckasggtfsnspinwlrgapggglewmgsiipsfgtan 59

```
This polypeptide sequence comprises the heavy chain variable region (VH), HBB6, obtained by mutagenesis of the VH CDR3 of human carcinomehyponic antigen (hCBA) specific antibody CEA6 (see W19881). A claimed specific binding member (A) comprises an HCBA specific antibody antigen binding demain that has a dissociation of specific antibody antigen binding demain that has a dissociation of constant for hCBA of less than 1 x 10 -8 M. Is non-cross-reartive with human liver cells, and preferentially binds to the A3-B4 extracellular domain of hCEA and/or to cell-associated hCEA over hCEA cover soluble hCEA. Preferred (A) include pairings of VH and VL sequences from CEA1-7 (see W1986-95), or their CBS sequences. as well as CEA6 VH and VL variants (see W1986-95) obtained by mutagenesis or chain shuffling. An example of a claimed pairing the HCEA, in vivo or in vitro, especially tumour cells for diagnosing cancer, e.g. adenocarcinoma of the colon. Uning or breast.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             60 yaq----kfqgrltitadeststaymelsslrsedtavyycaqrshty el-yyy--ymd lil

carcinoembryonic antiqen (hZEA)-specific antibody CEA6 (see W19881). "A claimed specific binding-member (A) comprises an hCEA specific antibody antiqen binding-domain that has a dissociation constant for hCEA of less than 1 x 10 - 8 M, is non-cross-reactive with human liver cells, and preferentially binds to the A3-B3 extracellular domain of hCEA and/or to cell-associated hCEA over scluble hCEA. Preferred (A) include pairings of VH and VL sequences from CEA1-7 (see W19876-85), or their CDR sequences, as well as CEA6 VH and VL variants (see W1986-55) obtained by mutagenesis or chain shuffling. (A) is used to detect cells expressing hCEA, in vivo or in vitro, especially tumour cells for diagnosing cancer, e.g. adenorarinoma of the colon, lung or breast.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          claim 4; Fig 2; 128pp; English.

This polypeptide sequence comprises the heavy chain variable region (VH), ToEDIO, obtained by mutagenesis of the VH CDR3 of human carcinoembryonic antigon (hCEA)-specific antibody CEA6 (see W1981). A claimed specific binding member (A) comprises an hCEA specific antibody antigen binding domain that has a dissociation constant for hCEA of less than 1 x 10 - 8 M, is non-cross-reactive with human liver cells, and preferentially binds to the A3-B3 extracellular domain of hCEA and/or to cell-associated hCEA over
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Specific binding members for human carcingembryonic antigen - bind to the A3-B3 extracellular domain of hCEA and are substantially non-cross-reactive with human liver cells, used for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Carrincembryonic antigen: CEA; human; antibody; soFv;
tumour marker; lung cancer; breast cancer; colon cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        07-DEC-1997 (first entry)
CEA-specific antibody CEA6 VH mutant T06D10 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note= "complementarity determining region 1"

A human anti-Varicella zoster virus monoclonal antibody was prepd.
using the tricma method of Ostborg of al. (1983) Hybridoma 2.361-367.
One resultant trioma neutralised VZV in the absence of complement.
This cell line, designated cell line 1C98RAP, produced an antibody designated 93RAP on the light and heavy chain variable region heavy chain (gamma-1) and two light chain (kappa) specific clones sequenced (see 082749 s Q82750 respectively).
                                                                                                                                                                                                                                                   1 qvqlv-qsgaevkkpgssvkvsckasggtfsnspinwlrqapggglewmgsiipsfgtan 59

httpA over soluble httpA. Freferred (A) include pairings of VH and VL sequences from CBA1-7 (see W19876-85), or their CDR sequences, as well as CBA5 VH and VL variants (see W1986-95) obtained by mutagenesis or chain shuffling. Lamples of claimed pairings are 105D10 VH with 105D12 or CBA6 VL. (A) is used to detect cells expressing httA, in vivo or in vitro, especially tumour cells for diagnosting cancer, e.g. adenocarcinema of the colon, lung or breast.

Claim 19; Page 75.76; 82pp; English.

A process for isolating and synthesising human monoclonal anti-tumour antibodies has been produced. The process involves: (a) constructing at least one fusion phage library from the peripheral blood lymphocytes the page library from the peripheral blood lymphocytes the page library from the peripheral blood lymphocytes the page library in a binding assay with cultured tumour antibodies in the phage library in a binding assay with cultured tumour antibodies in seep (b) and (c); (e) assaying the specificity of the cloned phage by incubating the phage with at least two types of cultured normal cells; and (f) further testing the specificity of cloned phage that do not bind to cultured tumour cells derived from more than one other tumour that is not the patient's tumour. The present sequence represents a human heavy continued tumour cells derived from more than one other tumour that is not the patient's tumour. The present sequence represents a human heavy and method as described above. The antibodies produced can be used for diagnostic and therapeutic applications and for isolating tumour more than one as an incommon for continued to the theory is a method as described above. The antibodies produced can be used for antipone from the patient's tumour general represents and for isolating tumour more than one as an anti-cancer vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               murine monoclonal antibodies (MAbs). Since the antibodies are isolated from fusion phage libraries, their affinity and specificity for a tumour cell line can be improved by genetic manipulations.

Claim 6; Page 22-23: 34pp; English.

The monoclonal antibodies (MAb's) designated GP13, GP44 and GP68

react with HiV-1 gp120 glyoptotein variants containing the amino acids Asn88, Lys17, Asn262 and Tyr 435 but exhibit at loost for reduced reacton with gp120 variants in which these amino acids have been deleted or substituted. The MAb's are useful for passive immunotherapy and their anti-idiotypic antibodies can be used in the production of vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 gvglv-gsgaevkkpgssvkvsckasggtfssstlnwvrgtpggglewmgkiiptlusst 59

Immunoglobulin trans.genes - for prodn. of heterologous

In on-rearranged and/or rearranged ig chains.

Example 14; Page 87; 112pp; English.

C. The human placental genomic DNA library cloned into the phage vector lambda FIX II was screened with the human VHI family cortor lambda FIX II was screened with the human VHI family coperitic oligonucleotide (see Q22418). Phage clone lambda C399016 of the phage clone lambda common the sequence of the phage clone is a specific oligonucleotide of 6.1 kb Xbal fragment contg. the variable sequence the phage clone of this insert was sequenced. VH49:8 was found to have an open reading frame which encoded the sequence shown.

                                                                                                                                                                                                                                                                                                        5, Gaps
                                                                   L-and H-chain DNA was amplified by PCP from Graves' orbital tissue and clones encoding autoimmune-associated immunoglobulin fragments were obtained. 13/15 clones of H chain (IgG1) genes showed homology to the closest germline genes, DP10 (089328) and hv1262 (089328). The DNA (089329) and corresp. amino acid (R72070) sequences of the VH region of a representative clone, sequence 98 AA.
                 'ophthalmopathy-associated monoclonal antibody - produced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         17-AUG-1992 (first entry)
Protein encoded by the human heavy chain V region gene VH49.8.
Heavy chain: variable region; VH1 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 515; DB 4; Length 117; Pred. Example 12, Fage 96, 196pp, English.

A human placental genomic DNA library cloned into the phage vector lambda FIX II was screened with the human VH1 family specific oligonucleotide Q44184. Phage clone lambda 49.8 was isolated and a fib Xbal fragment containing the variable, seyment VH49.8 was subcloned into pNNO3 to generate plasmid pVH49.8 An 800bp region of this insert was sequenced (Q44185) and VH49.8 found to have an open reading frame and inteat splicing and recombination signals, indicating that the gene is functional. Amino acid sequence Q44185 was deduced from the coding sequence; the last 3
                                                                                                                                                                                                                               Transgenic non-human animals contg. immunoglobulin heavy chain trans gene . used to produce useful antibodies by isotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        codons before the termination codon have not been translated.

Mean 41.620; Variance 105.958; scale 0 393 Statistics: Pred No is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

#title Developmentally restricted immunoglobulin neavy chain variable region gene expressed at high frequency in chronic lymphocytic leukemia.
#cross-references MUID:89345575
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          te the authors translated the codon GAC for residues 108 and 109 as Glu
The antibody is one of the cold agglutinins that preferentially bind red blood cell membrane antigens at low temperature, causing cold agglutinin disease (CAD).
